Three Axes Box Way

Perfect combination of
efficiency and stability

In response to heavy duty, general machining, and parts processing industries, FEELER provides the VBX series. Its high rigidity and high stability box way machining center has a stable structure. The three-axis is designed with a large span box way, and the heavy duty ability is excellent which present an extraordinary machining efficiency.

VBX-1100

VBX-1300

VBX-1400/1650

VBX-1900/2200

VBX SERIES

- The main body structure is made of Meehanite cast iron which the material is very stable, so the entire machine will not deform for a long life time.
- Three-axis ultra-wide box way rail, which greatly improves the rigidity and stability of the whole machine.
- The hard track is hardened by heat treatment and precision ground; the slideway surface is covered with Turcite-B, which has great wear resistance and ensures long-term accuracy.
- Three-axis ballscrew bearing is lubricated with oil to improve bearing life.
- Finite element analysis (FEM) software for dynamic simulation and structural analysis to ensure the machine achieves the best structural rigidity, machine accuracy and reliability.

Steady Mechanical Structure

Y-axis Front Chip Proof Cover

Scale-type Telescopic Cover
(VBX-1400/1650/1900/2200)

Flushing Device Telescopic Cover

Y-axis Rear Chip Proof Cover

Belt Type Spindle :
Easy for assembling
and maintenance.Gear Type Main Shaft :
Able to sustain low speed and high
torque load, suitable for low speed
and large deep machining.Direct-drive Spindle (DDS) :
Low transmission power loss, low-speed heavy
machining will not have belt-type tripping problems,
suitable for high-speed light machining.

Specially designed "A"-shaped
column bottom, strengthened
design, effectively improve
mechanical rigidity.

Worktable is capable for
heavy loading :
VBX-1100/1300 : 1300KG
VBX-1400 : 1500KG
VBX-1650 : 1800KG
VBX-1900 : 2200KG
VBX-2200 : 2700KG

High Precision Ball Screw :
X, Y, and Z axes are equipped
with precision ball screws,
which are pre-load to ensure
the best accuracy and
minimize the positioning error.

The base adopts a rigid design, which is resistant for
bending and torsion, thereby increasing the rigidity.

VBX-1100/1300/1400/1650/1900
Four Box Ways Base

The Y-axis stroke adopts four slide rails to
support, which is suitable for heavy loading.
Its structure is highly rigid and stable support.

VB-2200 - Six Box Ways Base
Specially designed six box ways
base structure for heavy load
support, which is extremely stable.

Machine Features

Spindle Coolant Nozzle

Powerful coolant flushing to remove metal chips with concentrated coolant. It helps to ensure accurate machining and to cool the cutting tool sufficiently which extends the service life of the cutting tool.

- Three-axis telescopic cover prevents chips and coolant from damaging the guide rail surface, ensuring machining accuracy and guide rail life.

Coolant Tank

Two removable filter box design, the filter is needed for alternately cleaning which prevents the pump from impurities of cutting fluid, effectively improving the pump life.

Two Channel Removable Filter Box Design

Chip Screws

Remove metal chip more quickly and efficiently.
(VBX-1400/1650/1900/2200 Standard)
(VBX-1100/1300 OPT.)

Coolant Flushing (OPT.)

Powerful flushing system can quickly and efficiently remove metal chips.

Air Gun and Coolant Gun Interface

The air gun and water gun connector are reserved for future usage.

▲ Air Gun(Standard) \ Coolant Gun (OPT.)

Dust-proof Electrical Cabinet

The electrical cabinet is dust proof. All wire through-holes are protected by water-resistant fittings to prevent oil moisture from entering. This extends the electronic part's service life and assures maximum reliability.

Gear Drive Transmission (OPT.)

Outstanding Features, Displaying Extraordinary Performance

Features of Gear Drive Spindle

- The spindle transmission is transmitted by gear, which upgrades rigidity and stability for heavy duty cutting.
- Two stage speed switch: Low speed / High torque (heavy duty cutting) High speed / Good for finish accurate cutting.

Coolant through spindle with floating unclamp mechanism eliminates bearing's Axial loading, thus increase spindle durability and accuracy.

Parallel axial centerline deployment, reinforces machining accuracy.

The head stock features box-structure with inner ribs enforcement, upgrades rigidity and stability for heavy duty cutting.

Direct transmission between moto and gear that delivers optimum power to the spindle.

Short Spindle nose increases rigidity, which reduces overhanging distance and increases cutting capabilities.

Spindle Cooling Device

The oil from the spindle cooling unit is particularly circulated around the spindle cartridge and spindle motor to maintain optimum running temperature to eliminate thermal expansion, and to prolong bearing life.

Floating Unclamp Mechanism

Eliminates bearing's axial loading and increase spindle durability.

A Good Partner of Production

FEELER INTELLIGENCE MONITORING (OPT.)

Thermal Compensation

After long term operation and workpiece machining, it would cause thermal deformation of machine structure to affect accuracy. According to the information of temperature changing, which are located in machine structure (around 4~8 locations) and 8 channels Thermal compensation system, which is developed by Feeler R&D team to calculate the differences of temperature to do thermal compensation. Hence, the machining deviation accuracy will be restrained under 0.02mm to increase machining quality.

Features

- Establish independent temperature rise and thermal displacement compensation technology
- Self-developed 8-channel thermal compensation card
- Solve the problem of thermal displacement of machines
- Thermal deviation can be controlled within 0.02mm
